***Abstract*—In this paper, we discuss various ways to extend the Thue-Morse sequence when used as a fair-share sequence. Included are N definitions of the original sequence, M extensions to n players, and proofs of equality for all definitions. In the appendix are several complexity analyses for both space and time of each definition.**

I. Introduction

II. The Original Sequence

A. Definition 1 - Parity

First, let us make sure we have a common definition of parity. For the purpose of this paper, this signifies whether there is an even or odd number of high bits in the binary representation of a number. It does not signify that the number as a whole is even or odd.

$$\begin{aligned} p(0) &= 0 \\ p(n) &= n + p\left(\left\lfloor \frac{n}{2} \right\rfloor\right) \pmod 2 \end{aligned} \tag{1}$$

Under this definition, you can construct the Thue-Morse Sequence using the following, starting at 0:

$$T_{2,1}(n) = p(n) \tag{2}$$

The subscript indicates that we are using 2 players (writing in base 2) and that we are using the first definition laid out in this paper. Note that when we extend to n players, the T function will get a second parameter for the number of players, so it will look like $T_{n,d}(x, s)$, where s is the size of the player pool.

B. Definition 2 - Invert and Extend

This definition is more natural to think about as extending a tuple that contains the sequence. We will give a recurrence relation below, but to build an intuition we will work in this framework first.

Let $t(n)$ be the first 2^n elements of the Thue-Morse Sequence. Given this, we can define:

$$\text{inv}(\mathbf{x}) = \begin{cases} 0, & \text{if } x_i = 1 \\ 1, & \text{if } x_i = 0 \end{cases} \quad \text{for } \mathbf{x} = (x_0, x_1, \ldots, x_{n-1}) \tag{3}$$

$$\begin{aligned} t(0) &= \langle 0 \rangle \\ t(n) &= t(n-1) \cdot \text{inv}(t(n-1)) \end{aligned} \tag{4}$$

Given the above, we can define a recurrence relation that will give us individual elements. It will be less efficient to compute, but will allow proofs of equivalence to be easier.

$$\begin{aligned} T_{2,3}(0) &= 0 \\ T_{2,3}(n) &= T_{2,3}\left(n - 2^{\lfloor \log_2(n) \rfloor}\right) + 1 \pmod 2 \end{aligned} \tag{5}$$

D. Definition 4 -

E. Definition 5 -

F. Summary

III. The Extensions

A. Definition 1 - Modular Digit Sums

To extend definition 1 from 2 to n players, we must first map our concept of parity to base n. We can do this by taking the parity equation defined above and replacing the 2s with n, as follows:

$$\begin{aligned} p_n(0) &= 0 \\ p_n(x) &= x + p_n\left(\left\lfloor \frac{x}{n} \right\rfloor\right) \pmod n \end{aligned} \tag{6}$$

Under this definition, you can construct the Thue-Morse Sequence using the following, starting at 0:

$$T_{n,1}(x, s) = p_s(x) \tag{7}$$

1) Proof of Equivalence with Orig. Def. 1:

B. Definition 2

In the original version of this definition, we inverted the elements. In base 2, this is the same thing as adding 1 (mod 2). Given that, let $t(x, n)$ be the first n^x elements of the Extended Thue-Morse Sequence.

$$\begin{aligned} \text{inc}(\mathbf{x}, n) &= x_i + 1 \pmod n \\ &\text{for } \mathbf{x} = (x_0, x_1, \ldots, x_{n-1}) \end{aligned} \tag{8}$$

$$\begin{aligned} t(0, n) &= \langle 0 \rangle \\ t(1, n) &= \langle 0, 1, \ldots, n-1 \rangle \\ t(x, n) &= t(x-1, n) \cdot \text{inc}(t(x-1, n), n) \end{aligned} \tag{9}$$

Given the above, we can define a recurrence relation that will give us individual elements. It will be less efficient to compute, but will allow proofs of equivalence to be easier.

$$\begin{aligned} T_{n,3}(0,s) &= 0 \\ T_{n,3}(x,s) &= T_{2,3}\left(x - s^{\lfloor \log_s(x) \rfloor}\right) + 1 \pmod s \end{aligned} \tag{10}$$

1) Proof of Equivalence with Orig. Def. 2:

C. Definition 3

1) Proof of Equivalence with Orig. Def. 3:

D. Definition 4

1) Proof of Equivalence with Orig. Def. 4:

E. Summary

IV. Proving Equivalence Between Extensions

A. Correlating Def. 1 and Def. 2

B. Correlating Def. 1 and Def. 3

C. Correlating Def. 1 and Def. 4

D. Summary

Acknowledgment

The preferred spelling of the word "acknowledgment" in America is without an "e" after the "g". Avoid the stilted expression "one of us (R. B. G.) thanks ...". Instead, try "R. B. G. thanks...". Put sponsor acknowledgments in the unnumbered footnote on the first page.

References

Please number citations consecutively within brackets [1]. The sentence punctuation follows the bracket [2]. Refer simply to the reference number, as in [3]—do not use "Ref. [3]" or "reference [3]" except at the beginning of a sentence: "Reference [3] was the first ..."

Number footnotes separately in superscripts. Place the actual footnote at the bottom of the column in which it was cited. Do not put footnotes in the abstract or reference list. Use letters for table footnotes.

Unless there are six authors or more give all authors' names; do not use "et al.". Papers that have not been published, even if they have been submitted for publication, should be cited as "unpublished" [4]. Papers that have been accepted for publication should be cited as "in press" [5]. Capitalize only the first word in a paper title, except for proper nouns and element symbols.

For papers published in translation journals, please give the English citation first, followed by the original foreign-language citation [6].

V. Appendix

A. Complexity of Extension 1

1) Time Complexity:

2) Space Complexity:

B. Complexity of Extension 2
